Application of the Tight Fit Kit into Fan Coil Units

The Fresh-Aire Tight Fit Kit is an ideal kit for installation into many of the fan coil units found in the market today. The kit provides a means for locating the UV light within the fan coil units for optimum UV exposure.

The kit comes with a magnetic mounting shield that simply clips inside of the interior return chamber of the air handler and can be positioned to cover the surfaces that are prone to the worst growth.

A 24 VAC power supply powers the UV light from the 24 VAC transformer found on board the control panel of the air handler.
