

# ICE UV LED™

Ice UV LED features two types of LED emitters that target different areas of the ice machine.

## The First Comprehensive UV LED Ice Machine Disinfection System

The ICE UV LED system is designed to disinfect the interior of ice machines, flakers, and water dispensers. The system helps to eliminate and prevent slime, pathogens, and other microbial contamination from problem areas of ice machines. These include the bin, dispenser, sump and accumulator.

## The Solution For Clean Ice

Ice machines are prone to microbial growth as a result of condensation in the sump area and the ice collector and bin. A proactive approach that prevents contamination is far superior to one that addresses the contamination once it is already an issue.

Unlike conventional ozone treatments that may make internal components brittle, there is no such issue when using the plastic-friendly LED system. These LEDs feature a +50,000 hour operating life and are easily replaced when required. Ice UV LED is relatively inexpensive and the cost-savings associated with using it are substantial. It disinfects continually, which dramatically reduces ice machine maintenance down-time.
